# EXPLORATORY DATA ANALYSIS ON ZOMATO

MAY 2024

Prepared By ~ Shelly Garg

# CONTENTS

- **Introduction**
- **Objective**
- **Data Overview**
- **Analysis**
- **Marketing Strategies**

# Introduction

The dataset pertains to Zomato, a prominent food delivery company operating in India. Zomato facilitates the delivery of food from various restaurants and cafes to customers. It encompasses a wide array of information related to restaurants, including their names, locations, cuisines, price ranges, ratings, and more. This dataset offers valuable insights into the food industry landscape, customer preferences, restaurant distribution, and market trends, enabling comprehensive analyses and informed decision-making for stakeholders within the food delivery domain.

# Objective

To utilize exploratory data analysis (EDA) skills to understand customer preferences, dining trends, and competitive landscape in various regions of India, and to design an effective marketing campaign for a restaurant chain.

# Data Overview

Total Rows: 211944

Total Columns: 26

1. `res\_id`: Unique identifier for each restaurant.
2. `name`: Name of the restaurant.
3. `establishment`: Type of establishment (e.g., cafe, fine dining).
4. `url`: URL link to the restaurant's page on the Zomato platform.
5. `address`: Physical address of the restaurant.
6. `city`: City where the restaurant is located.
7. `city\_id`: Unique identifier for each city.
8. `locality`: Specific locality within the city.
9. `latitude`: Latitude coordinate of the restaurant's location.
10. `longitude`: Longitude coordinate of the restaurant's location.
11. `zipcode`: Zip code of the restaurant's location.
12. `country\_id`: Unique identifier for the country.
13. `locality\_verbose`: Detailed description of the locality.
14. `cuisines`: Types of cuisines offered by the restaurant.
15. `timings`: Operating hours of the restaurant.
16. `average\_cost\_for\_two`: Average cost for two people dining at the restaurant.
17. `price\_range`: Price range category of the restaurant.
18. `currency`: Currency used for pricing.
19. `highlights`: Special features or offerings of the restaurant.
20. `aggregate\_rating`: Overall rating of the restaurant.
21. `rating\_text`: Descriptive rating text (e.g., Excellent, Good).
22. `votes`: Number of votes or ratings received.
23. `photo\_count`: Number of photos available for the restaurant.
24. `opentable\_support`: Indicator of OpenTable support.
25. `delivery`: Indicator of delivery service availability.
26. `takeaway`: Indicator of takeaway service availability.

# Analysis Findings

## Exploratory Data Analysis

### Number of Unique Restaurants

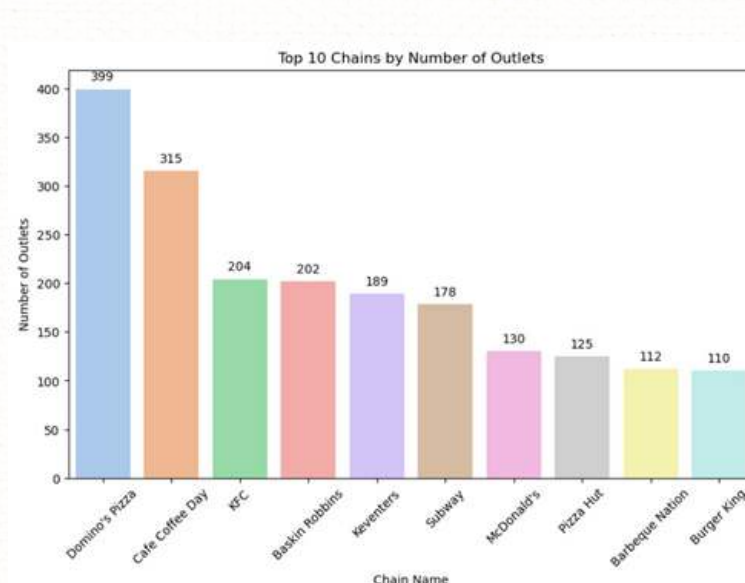

The dataset comprises information on a total of 41,100 unique restaurants. These establishments represent a diverse array of culinary offerings available through the Zomato food delivery platform.

### Chain vs. Single Restaurants

Upon further exploration, it was revealed that among these restaurants, 4,890 are part of chains, while the majority, totaling 36,210, operate independently as single establishments. This insight sheds light on the composition of the restaurant landscape within the dataset, highlighting both the presence of well-established chains and the prevalence of independently-owned dining venues.

### Top 10 Chains by Number of Restaurants

To better understand the distribution of chain restaurants within the dataset, a visualization was generated to showcase the top 10 chains based on the number of restaurants they operate. This analysis provides valuable insights into the market dominance of certain restaurant chains within the scope of the dataset.

# Analysis Findings

## Exploratory Data Analysis

### Number of Cities

The dataset encompasses data from a total of 99 cities, reflecting the widespread geographical coverage of the Zomato food delivery service. This broad representation underscores the platform's extensive reach across various urban centers.

### Number of Restaurants by City

To visualize this distribution, a bar chart was employed to illustrate the number of restaurants present in each city. Bangalore emerged as the city with the highest number of restaurants, boasting a total of 2247 establishments. Conversely, Nayagaon stood out as the city with the least number of restaurants, with a modest count of 15 dining venues. This analysis offers insights into the concentration of dining options within different urban locales, thereby facilitating a better understanding of the regional restaurant landscape.

# Analysis Findings

## Exploratory Data Analysis

### Culinary Insights

Exploring culinary diversity, the analysis uncovered 134 unique cuisines within the dataset. The following bar chart highlighted the top 10 most popular cuisines, with North Indian cuisine being the most popular cuisine. This finding underscores the enduring appeal of traditional Indian flavors and provides valuable insights into evolving dining preferences.

### Establishment Trends

Investigating the diverse landscape of dining establishments, the analysis identified 26 distinct types. Quick bites emerged as the dominant establishment type. Conversely, pop-up establishments were found to be less prevalent, indicative of their niche appeal. The following bar chart highlights the top 10 establishments based on restaurant count, offering a snapshot of the dining landscape's varied offerings.

# Analysis Findings

## Exploratory Data Analysis

### Restaurant Distribution by Price Range

To understand the pricing dynamics across restaurants, the following bar chart visualizes the distribution of restaurants based on their price ranges. This analysis provides insights into the affordability spectrum available to customers, aiding in strategic decision-making for restaurant selection.

### Restaurant Ratings

Analyzed the distribution of ratings across restaurants to understand how ratings are distributed among different dining establishments. Using this information, following bar chart is created to visualize the frequency of ratings awarded to restaurants. (0.0 ratings means not rated)

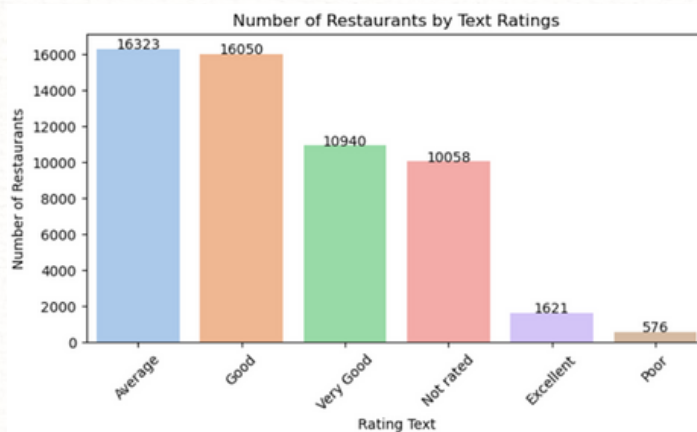

# Analysis Findings

## Exploratory Data Analysis

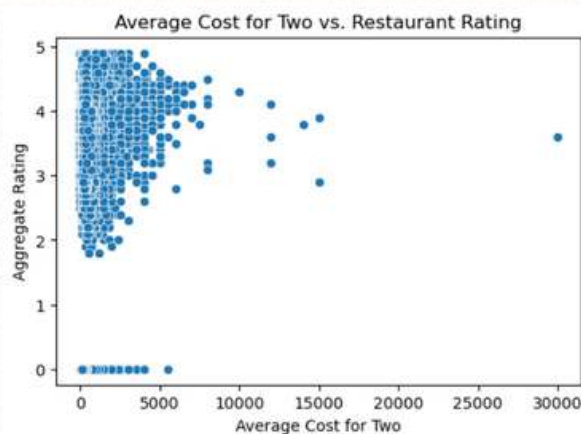

### Text Ratings Analysis

Analyzed the distribution of text ratings, which encompass ratings such as "Excellent," "Very Good," "Good," "Average," "Poor," and "Not Rated." The following bar chart illustrates the distribution of restaurants based on text ratings, highlighting "Average" as the most common rating.

### Analysis of Average Cost for Two and Aggregate Rating

The correlation coefficient, which quantifies the strength and direction of this relationship, was calculated to be approximately 0.25. This positive correlation coefficient suggests a weak to moderate positive linear relationship between the average cost for two people and the aggregate rating. In simpler terms, as the average cost for two increases, there tends to be a slight tendency for the aggregate rating to also increase, and vice versa.

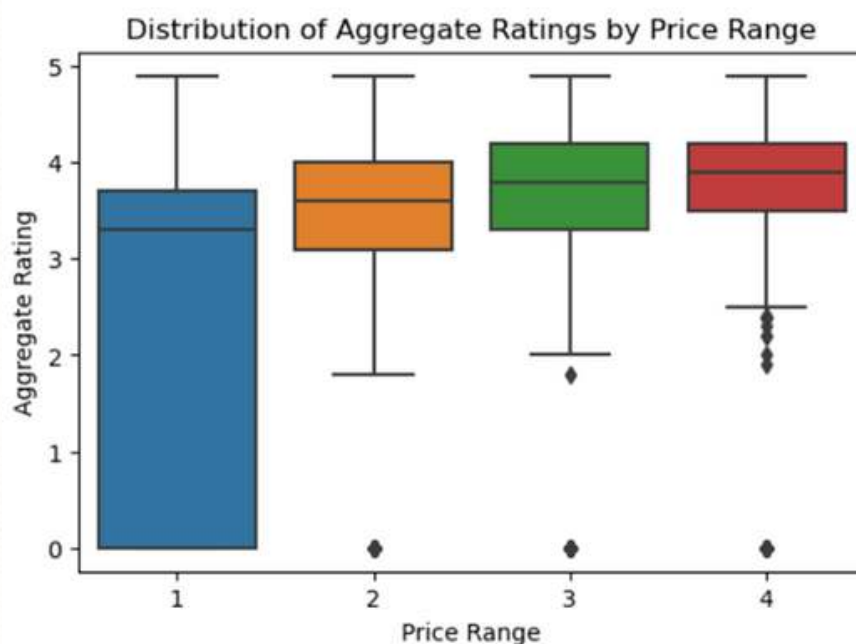

# Analysis Findings

## Exploratory Data Analysis

### Analysis of Aggregate Rating and Price Range

The analysis of variance (ANOVA) is conducted to investigate the relationship between the price range of restaurants and their aggregate ratings. The ANOVA F-statistic was found to be approximately 1368.32, and the p-value was determined to be 0.0. The ANOVA F-statistic assesses whether there are statistically significant differences in the means of aggregate ratings across different price ranges. In this case, the high F-statistic value indicates that there are significant differences in aggregate ratings among different price ranges. The p-value associated with the ANOVA test represents the probability of observing such extreme differences in aggregate ratings across price ranges if the null hypothesis were true (i.e., if there were no differences in ratings among price ranges). With a very low p-value of 0.0, we reject the null hypothesis and conclude that there are indeed significant differences in aggregate ratings across price ranges.

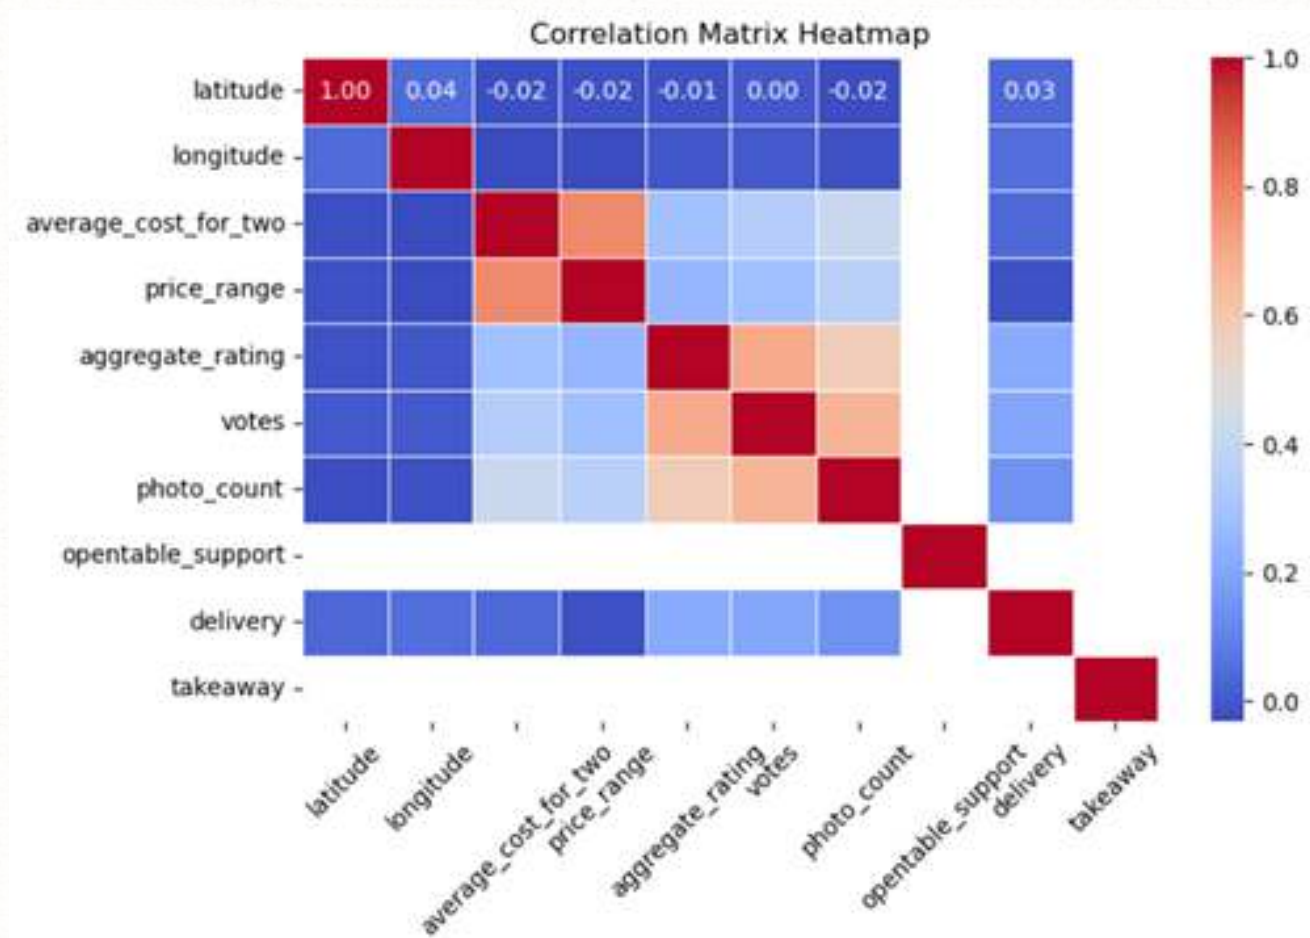

# Analysis Findings

## Exploratory Data Analysis

### Correlation Matrix Heatmap

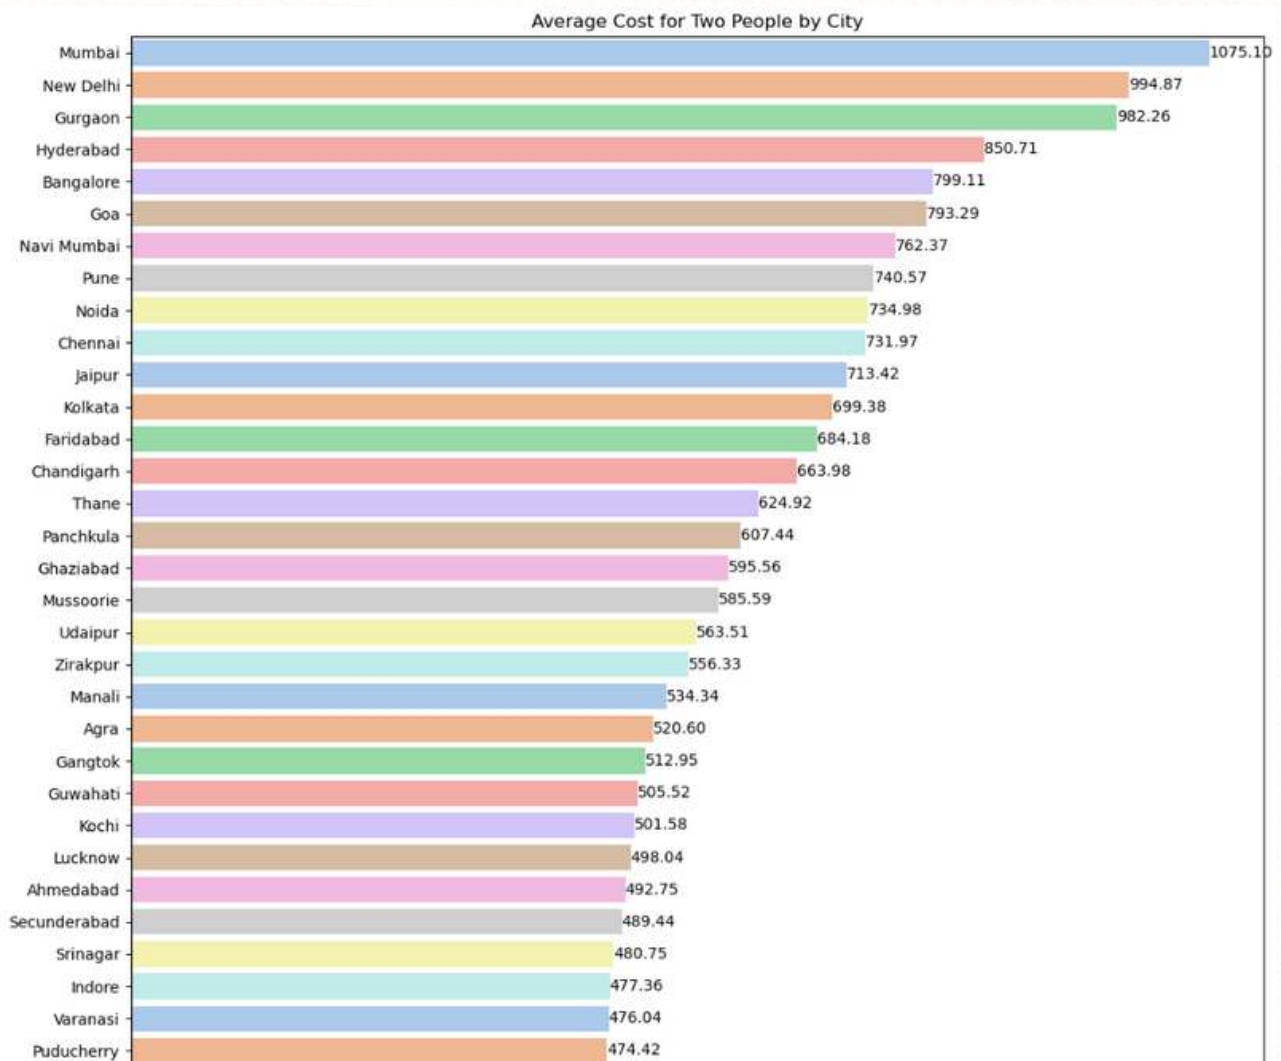

# Analysis Findings

## Regional Analysis

### Analysis of Average Cost for Two People Across Cities

The bar plot illustrates the average cost for two people in various cities, providing insights into the cost of dining out across different locations. This analysis helps stakeholders understand the affordability of restaurants in different areas, allowing for informed decision-making regarding restaurant selection and market strategies.

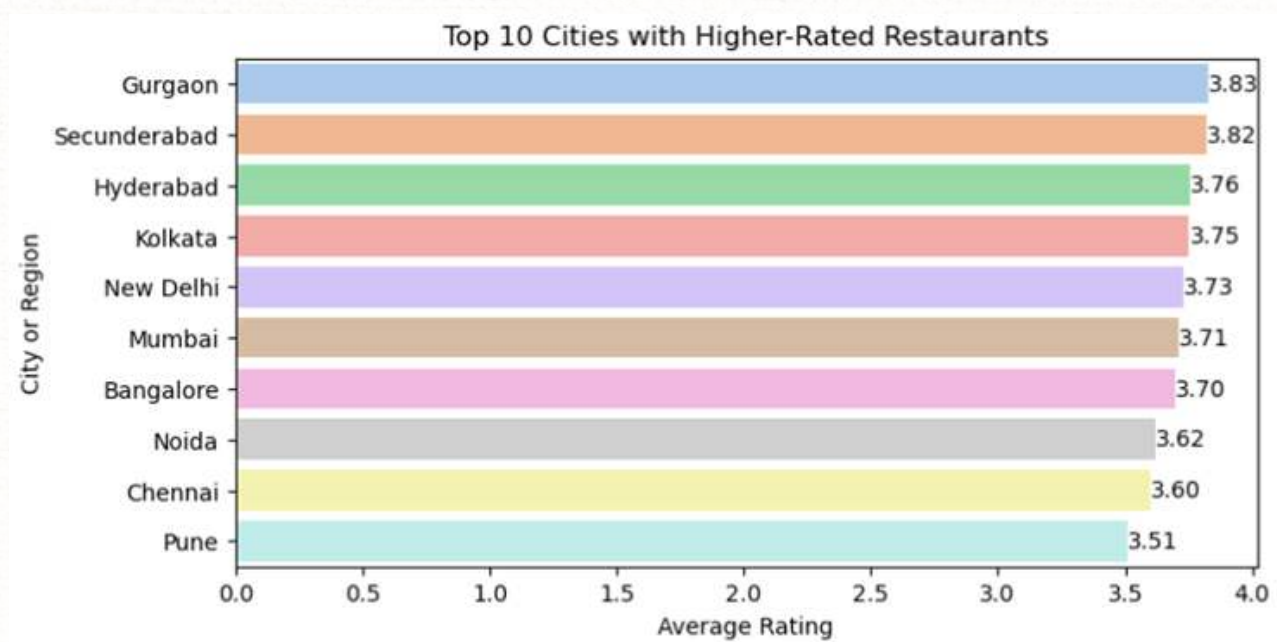

# Analysis Findings

## Regional Analysis

### Areas with Higher-Rated Restaurants

During analysis, areas with higher-rated restaurants were identified. Gurgaon emerged with the highest average rating of 3.83, indicating a strong reputation for quality dining experiences. Conversely, Alappuzha recorded the lowest average rating of 0.38, suggesting a need for improvement in the local restaurant scene. To visualize this analysis, a bar plot is used to showcase the top 10 areas with the highest-rated restaurants.

# Analysis Findings

## Regional Analysis

### Cities with the Highest Total Number of Votes

When analyzing cities with the highest total number of votes for restaurants, Bangalore stood out with the highest total votes, amounting to 1,628,941, indicating a vibrant restaurant culture and active engagement from customers. Conversely, Kharagpur recorded the lowest total votes at just 46, suggesting a comparatively smaller presence or lower engagement in the restaurant scene.

# Analysis Findings

## Customer Preference Analysis

### Most Popular Cuisines in Each City

This analysis focused on identifying the most popular cuisines in each city, shedding light on the culinary preferences across different geographical locations. The table visual showcased the predominant cuisines in each city, highlighting the unique gastronomic preferences of local communities.

Most Popular Cuisine by City

City	Most Popular Cuisine
Agra	North Indian
Ahmedabad	North Indian
Ajmer	North Indian
Alappuzha	Kerala
Allahabad	North Indian
Amravati	North Indian
Amritsar	North Indian
Aurangabad	North Indian
Bangalore	North Indian
Bhopal	North Indian
Bhubaneshwar	North Indian
Chandigarh	North Indian
Chennai	North Indian
Coimbatore	South Indian
Cuttack	North Indian
Darjeeling	Chinese

## Customer Preference Analysis

### Relationship Between Restaurant Ratings, Price Range, and Popularity

This analysis analyzes the intricate relationship between restaurant ratings, price range, and popularity to discern any correlations that could influence consumer behavior and business performance. The correlation matrix presented below provides insights into the interplay between these variables:

Correlation Matrix:

	price_range	aggregate_rating	votes
price_range	1.000000	0.252312	0.245646
aggregate_rating	0.252312	1.000000	0.283373
votes	0.245646	0.283373	1.000000

**Price Range and Aggregate Rating:** The correlation coefficient of approximately 0.25 suggests a weak positive correlation between price range and aggregate rating. While there is some degree of association, it is not particularly strong, indicating that higher-priced restaurants do not necessarily guarantee higher ratings.

**Price Range and Votes:** Similarly, the correlation coefficient of around 0.25 indicates a weak positive correlation between price range and the number of votes received by restaurants. This suggests that restaurants with higher price ranges tend to attract more votes from customers, albeit the relationship is not very strong.

**Aggregate Rating and Votes:** The correlation coefficient of approximately 0.28 signifies a weak positive correlation between aggregate rating and the number of votes. This implies that restaurants with higher ratings are more likely to receive a greater number of votes from customers, although the relationship is moderate at best.

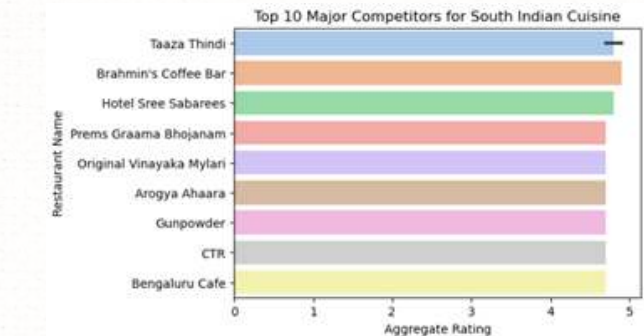

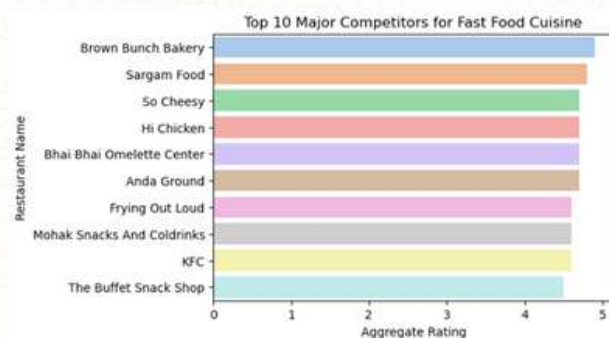

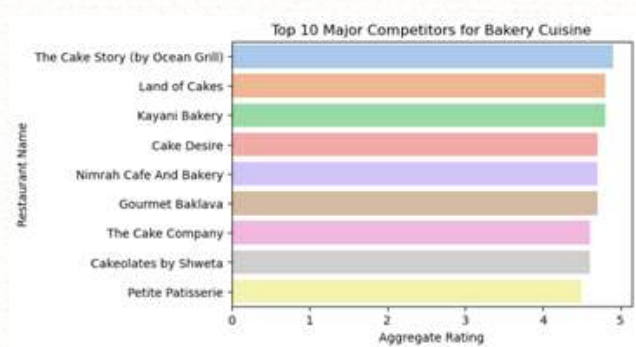

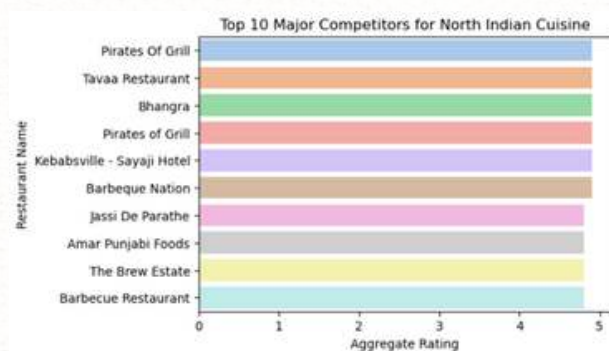

# Analysis Findings

## Customer Preference Analysis

### Identifying Major Competitors Based on Cuisine

The analysis aimed to identify major competitors within the restaurant industry based on cuisine preferences. By analyzing the top 5 cuisines favored by customers, valuable insights into the competitive landscape and discerned key players in each culinary category were gained.

# Analysis Findings

## Customer Preference Analysis

### Identifying Major Competitors Based on Pricing

The analysis aimed to identify major competitors in each city based on four distinct pricing tiers, offering valuable insights into the competitive landscape across different market segments.

#### Price Range 1:

Major competitors in the top three cities for price range 1 were identified, showcasing establishments catering to budget-conscious customers. A bar plot visualization illustrated the competitive landscape in each city, providing insights into key players dominating this price segment.

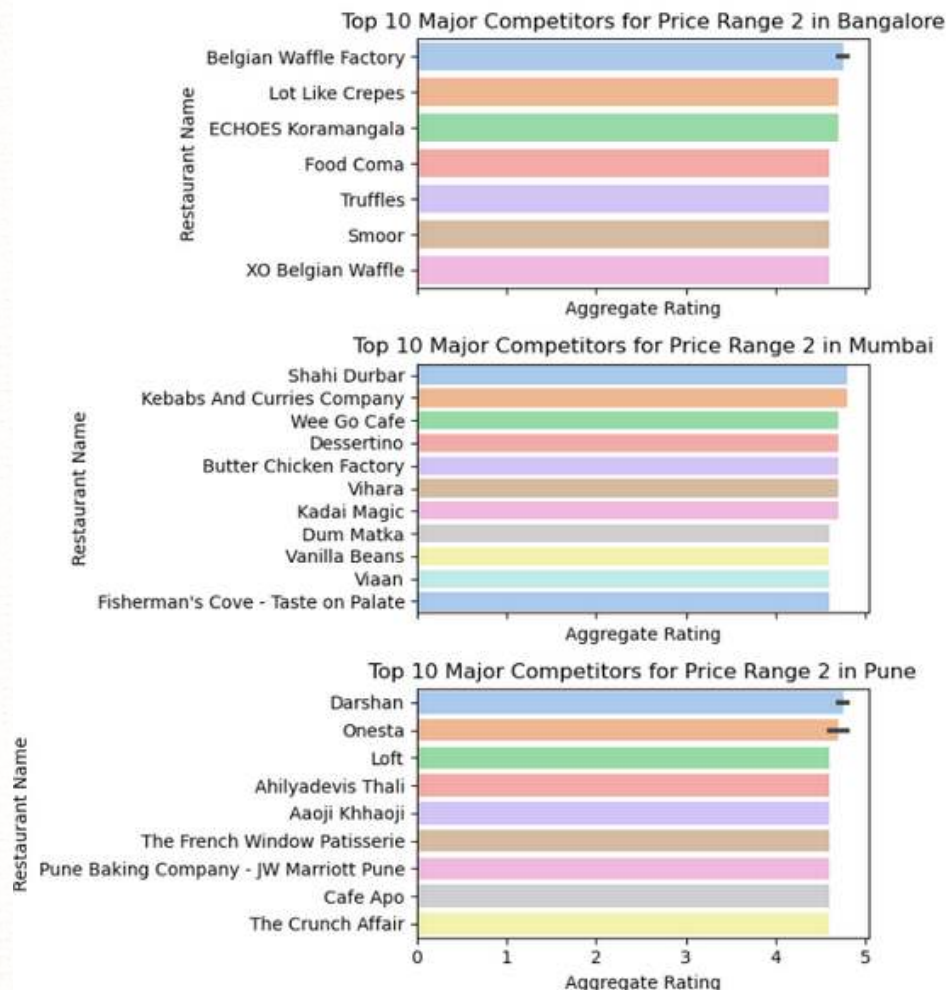

# Analysis Findings

## Customer Preference Analysis

### Identifying Major Competitors Based on Pricing

#### Price Range 2:

Analysis of major competitors in the top three cities for price range 2 revealed establishments offering moderately priced dining experiences. The bar plot depicted the competitive dynamics within each city, offering insights into key players shaping the mid-range pricing segment.

# Analysis Findings

## Customer Preference Analysis

### Identifying Major Competitors Based on Pricing

#### Price Range 3:

Looking into major competitors in the top three cities for price range 3 unveiled upscale establishments targeting premium clientele. The bar plot visualization elucidated the competitive landscape in each city, offering valuable intelligence for businesses operating in the high-end dining segment.

# Analysis Findings

## Customer Preference Analysis

### Identifying Major Competitors Based on Pricing

#### Price Range 4:

Identification of major competitors in the top three cities for price range 4 highlighted establishments offering luxury dining experiences. Through a bar plot, businesses gained insights into the competitive dynamics within each city's high-end dining segment.

# Market Strategies

## Customer Preference Analysis

### Campaign Overview

The marketing campaign leverages insights from the comprehensive analysis of restaurant data to craft targeted strategies aimed at maximizing market penetration, enhancing customer engagement, and differentiating the brand from competitors. By focusing on specific regions, customer segments, and promotional tactics, the campaign aims to drive brand visibility, attract new customers, and foster loyalty among existing patrons.

### Target Regions

**Metropolitan Areas:** Focus on major metropolitan areas such as Bangalore, Mumbai, and Delhi, leveraging their dense population and diverse culinary preferences.

**Emerging Markets:** Target emerging markets like Pune, Hyderabad, and Kolkata, capitalizing on growing urbanization and consumer spending power.

### Target Customer Segments

**Food Enthusiasts:** Engage food enthusiasts and connoisseurs by highlighting unique cuisines, chef specials, and culinary experiences.

**Health-Conscious Consumers:** Appeal to health-conscious consumers with options such as organic ingredients, gluten-free dishes, and low-calorie meals.

**Tech-Savvy Millennials:** Leverage digital channels and social media platforms to reach tech-savvy millennials, offering online ordering, exclusive app discounts, and interactive promotions.

**Family Diners:** Attract families with special promotions such as "Kids Eat Free" nights, family meal deals, and themed dining events.

# Market Strategies

## Customer Preference Analysis

### Differentiation Strategies

**Diverse Menu Selection:** Emphasize the diversity of the menu, showcasing a wide range of cuisines, from traditional Indian to international fusion dishes.

**Quality and Freshness:** Highlight the use of high-quality ingredients, fresh produce, and authentic recipes to underscore the brand's commitment to culinary excellence.

**Unique Dining Experiences:** Create memorable dining experiences through live cooking demonstrations, themed events, and pop-up collaborations with renowned chefs.

**Personalized Service:** Offer personalized recommendations, customized meal options, and attentive service to enhance the overall dining experience.

### Promotional Tactics

**Limited-Time Offers:** Introduce limited-time menu items, seasonal specials, and promotional combos to create a sense of urgency and drive foot traffic.

**Loyalty Programs:** Implement a tiered loyalty program offering rewards points, exclusive discounts, and birthday perks to incentivize repeat visits and foster customer loyalty.

**Special Events:** Host special events such as food festivals, wine tastings, and cooking workshops to attract food enthusiasts and generate buzz around the brand.

**Social Media Campaigns:** Launch targeted social media campaigns featuring engaging content, user-generated reviews, and influencer partnerships to increase brand visibility and drive online engagement.

**Community Engagement:** Participate in local community events, sponsor charity initiatives, and collaborate with neighborhood organizations to build goodwill and strengthen brand affinity.
